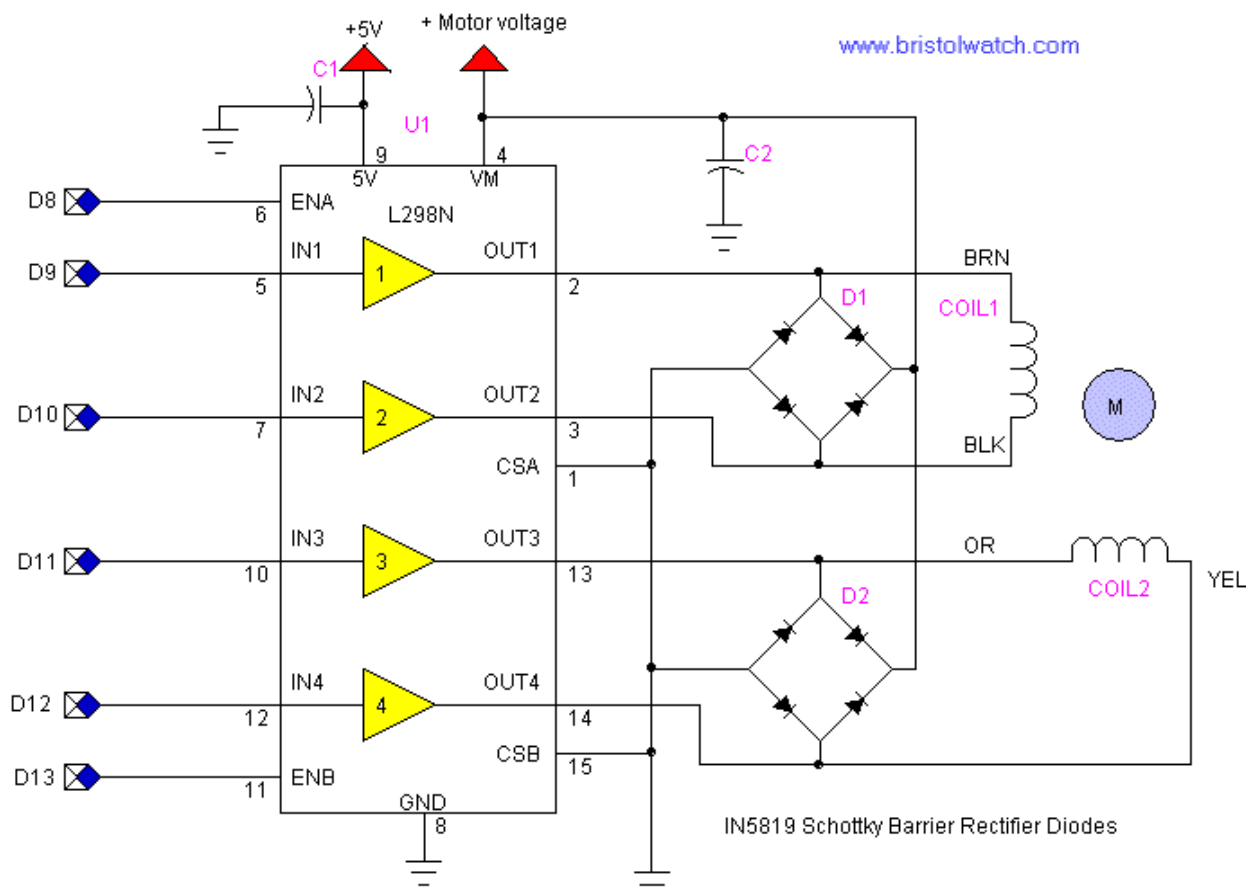

Figure 1 L298N Dual H-Bridge connected to a bi-polar stepper motor.

## Connecting the Arduino to a L298N H-Bridge

by Lewis Loflin

Earlier we looked at [L298N Motor Controller Theory and Projects](#) to understand the basic operation of the L298N dual H-bridge motor controller. In this section I've connected the L298N to a bi-polar stepper motor and connected it to the ATmega168 aka Arduino micro-controller. Note the motor voltage is the voltage rating of the stepper motor up to 40 volts and a current limit of four amps.

The Arduino series of micro-controllers are an outstanding value for the hobbyist and student to learn the basics of programming and interfacing micro-controllers. In this example in both hardware and programming the code below will operate the stepper motor through the L298N. The steppers I used in the example are all 7.5 degrees per-step and require 48 steps to go 360 degrees. Stepper motors are very accurate and often don't need feedback to tell position.

A bi-polar stepper motor has only two coils and operates by reversing the polarity unlike a [unipolar stepper motor](#) that operates by switching four coils on/off.

2/6

color of the wires on several units removed from junk printers.

Numbers such as PM425-048 and PM35s-048.

This also worked on a unipolar stepper such as a Portescape s6mo48 from Ebay leaving the red/green wires that went to +12 disconnected and operating at 24 volts.

    }
}

```

```

}

// all outputs to stepper off
digitalWrite(ENA, LOW);
digitalWrite(ENB, LOW);

} // end forward()

```

Figure 3

Shown above is a pre-assembled board I bought off Ebay for \$8 with shipping. This included power connectors, diodes, LED indicators, and even a 5-volt regulator. This is in my opinion the smart way to go to save time, money, and effort.

### Added January 2012: PICAXE Micro-controller Projects!

The PICAXE series of micro-controllers rank as the easiest and most cost effective way to use Microchip processors. I wanted

an easier and less expensive way to introduce my students to the "PIC" micro-controller. Here I hope to get those starting out past poorly written literature and lack of simple working code examples.
